City of Waukesha  
Planning Commission

March 7, 2016

Dear Planning Commission,

The General Electric Healthcare facility located at 3000 N. Grandview Blvd. desires to install a 1.2MW ground level solar installation on a vacant portion of its existing property. In support of this objective we are submitting the enclosed Application for Review and Conditional Use Permit application.

The goal of the project is to provide the GE Healthcare facility with a cost effective source of renewable energy. The energy produced by the system will be entirely consumed by the site and will not be exported back to the grid.

The project is planned to break ground in June 2016 with all construction completed by September, pursuant to approval of the City of Waukesha. An interconnection application has been submitted and approved by WE Energies for the installation and connection of the project. Additionally, due to the proximity to the local airfield the FAA has been notified of the proposed project which is currently under review and has been assigned case #2016AGL3584OE.

In addition to the proposed site drawings you will find photographs and example drawings for the planned racking system. The intent is to provide the Commission with a better visualization of the design.

We at GE are excited about this project and look forward to engaging with the Planning Commission to address any question that may arise.

Respectfully,

Cory Schaeffer  
Senior Project Manager
